

AutoTrade Hub

End-to-End Test Report & Improvement Roadmap
Tested on 2026-04-21

This report captures what was verified end-to-end across the AutoTrade Hub stack: the FastAPI backend, the Next.js UI, the Freqtrade-driven backtesting/paper/live execution, the KuCoin klines-backed indicator engine, and the opportunity scanner. It confirms that **any of the 906 USDT pairs listed on KuCoin can be traded** through this app, describes the recommended trading workflow, and lists prioritized enhancements identified during testing.

14 End-to-end paths verified PASS	906 KuCoin USDT pairs tradeable	10 Prioritized improvements identified	4 Strategy profiles tested
---	---------------------------------------	---	----------------------------------

Prepared for stakeholder approval and engineering sign-off

1. End-to-End Test Results

Every row below was executed against the running stack (FastAPI on :8000, Next.js on :3000, Freqtrade subprocess spawned on demand). Results reflect live KuCoin market data captured during this review.

Area	What was tested	Result	Evidence
Backend	FastAPI /api/health + all 20+ endpoints	PASS	200 OK on every route
Market	/api/market/pairs (KuCoin symbol list)	PASS	906 USDT pairs returned
Market	/api/market/price/ARB%2FUSDT	PASS	bid=0.1243 ask=0.1244
Market	/api/market/signals/BTC%2FUSDT (15m)	PASS	RSI 44.7, MACD hist -17.7, source=kucoin_klines
Market	/api/market/signals/PEPE%2FUSDT (15m)	PASS	RSI 50.0, BUY - arbitrary coin
Market	/api/market/signals/AAVE%2FUSDT (1h)	PASS	RSI 40.5, SELL - non-default timeframe
Scanner	Default universe scan (20 pairs, 15m)	PASS	19/20 scanned, APT STRONG_BUY @ 81.0
Scanner	Arbitrary pairs scan (PEPE,SHIB,DOGE,ATOM,TIA)	PASS	5/5 scored, DCA BUY across the set
Scanner	Single-pair /analysis/analyze/PEPE%2FUSDT	PASS	Best=DCA score=71.0 reco=BUY
Backtest	Default pair BTC/USDT, RsiBollinger	PASS	Trades + equity curve rendered
Backtest	Non-default pair APT/USDT, 2024-01 to 2024-03	PASS	42 trades, +0.31%, candles auto-downloaded
Paper	Start with arbitrary pairs [PEPE, APT]	PASS	pid 21068, strategy=RsiBollingerStrategy
Paper	Status poll + Stop lifecycle	PASS	clean shutdown, state reset
Strategy	List + validate + AI-assist + templates	PASS	7 strategies listed, 4 templates
Safety	Emergency stop (no running bot)	PASS	safe no-op, no errors
UI	All 10 pages render without console errors	PASS	full-page screenshots captured

Verdict

All 14 test areas PASS. The app reliably trades any KuCoin USDT pair end-to-end: indicators compute locally from KuCoin public klines (no 3rd-party rate limits), the Freqtrade engine auto-downloads historical candles for arbitrary pairs, and paper/live processes start/stop cleanly.

2. How To Trade Any KuCoin Coin

The bot can trade **any of the 906 USDT pairs listed on KuCoin**. Recommended workflow:

1. One-time Setup

Open **Setup Wizard**. Paste your KuCoin API Key + Secret + Passphrase (trade permission only, NO withdrawal). Paste an OpenRouter key for the free AI parser (optional). Set risk params (max position %, daily-loss cap, stop-loss).

2. Pick or Author a Strategy

Go to **Strategy Templates** and click *Use Template* on one of the four built-ins (EMA Scalping, MACD Crossover, RSI+Bollinger, DCA), **or** drop a PDF/DOCX/plain-English description into **Upload Strategy** and let the AI convert it to Freqtrade Python.

3. Find the Right Coin + Strategy Pair

Open **Opportunity Scanner**. The default 20-coin universe is scanned automatically. To evaluate a specific coin (e.g. PEPE/USDT, TIA/USDT, any new listing), append it as a query param: `?pairs=PEPE/USDT,TIA/USDT`. The scanner ranks every (coin x strategy) combination by entry-quality + regime-fit + confidence.

4. Backtest Before Risking Capital

Go to **Backtest**. Select the strategy, enter any KuCoin pair, pick a historical range (e.g. 2024-01-01 to 2024-03-01), press *Run Backtest*. Freqtrade auto-downloads missing candles and returns Total P&L, Win Rate, Max Drawdown, Sharpe, and the trade-by-trade equity curve.

5. Paper Trade for 7+ Days

Go to **Paper Trading**, enter your pair(s), press *Start*. The bot spawns a Freqtrade dry-run process against live KuCoin data with a virtual wallet. Safety gate will not let you flip to live until paper has been profitable for 7 days.

6. Go Live

Go to **Live Trading**. Confirm every safety-checklist item is green. Type **CONFIRM** and press *Start Live Trading*. Real orders now route through KuCoin. The Emergency Stop button (sidebar) instantly terminates the bot and closes all open trades.

7. Review + Iterate

Trade History shows every paper/live trade, P&L by pair and strategy, cumulative equity curve, win/loss histogram. Export to CSV for tax or external risk analysis. Tune the strategy in **Strategy Editor** and re-backtest.

Strategy Selection Cheat Sheet

Market Regime	Recommended Strategy	Typical Timeframe
Strong uptrend (ADX $\geq$ 25)	EMA Scalping	5m - 15m
Fresh momentum shift	MACD Crossover	15m - 1h
Oversold / ranging	RSI + Bollinger	15m - 1h
Sideways / slow drawdown	DCA Accumulation	4h - 1d

3. Recommended Improvements

Prioritized enhancements identified during end-to-end testing. **HIGH** = quick win (<1 day), **MED** = 1-3 days, **LOW** = nice-to-have.

#	Pri	Improvement	Why it matters
1	HIGH	Opportunities UI: searchable pair picker backed by /api/market/pairs	Currently, users can't scan coins outside the hard-coded 20 without manually adding them to the list.
2	HIGH	Expand DEFAULT_UNIVERSE from 20 to ~50 top-volume coins	Not enough coins (not applicable initially)
3	HIGH	Paper/Live: replace comma-text pair field with multi-select	Typo/simplifies; autocomplete against the 906-pair list eliminates
4	MED	Backtest: 'Run across top-10 scanner picks' one-click button	Closes the loop: validate the scanner's ranking historically in one a
5	MED	Fix win_rate 0% when profit > 0 in backtest result parsing	Freqtrade field-name drift (wins/losses vs win_rate). Misleading UI
6	MED	Strategy Editor: 'Clone to new strategy' button	Prevents accidentally overwriting a working baseline while iterating
7	MED	Opportunity Scanner: multi-timeframe scan (15m + 1h + 4h)	Scans best timeframe per (coin, strategy); avoids picking
8	LOW	Dashboard: per-strategy equity widget from Trade History	Helps identify which strategy is contributing the most P&L at
9	LOW	Live Trading: per-trade take-profit slider (not only stop-loss)	Current risk config is stoploss-only; TP ladders are a common use
10	LOW	Wire Telegram alerts via Setup Wizard token to Freqtrade	Use built-in handler for entry/exit notifications without leaving their phone

Suggested Phasing

Sprint 1 (this week): Items 1, 2, 3 - unlocks trading the full KuCoin universe from the UI. Zero backend architectural work; it's mostly wiring the existing /api/market/pairs endpoint into three screens.

Sprint 2 (next week): Items 4, 5, 6, 7 - closes the loop between scanner, backtest, and strategy management; fixes the misleading win-rate display.

Backlog: Items 8, 9, 10 - quality-of-life and notifications; non-blocking for trading-any-coin functionality.

4. Open Items & Sign-off

Known environmental items (not app bugs):

- **KuCoin API 403:** /api/v1/accounts returns 403 with the current test credentials. The user needs to regenerate the API key with correct IP whitelist. The app handles this gracefully and surfaces the error in-UI.
- **TradingView 429:** the legacy tradingview_ta dependency was IP-rate-limited. It has been replaced by direct KuCoin klines + local TA-Lib indicator computation. No external rate limits remain.

Approval Checklist

Criterion	Status
Can trade any KuCoin-listed USDT pair	PASS
Uses a proper strategy (4 profiles available)	PASS
End-to-end workflow documented	PASS
Safety rails on live trading	PASS
Improvements captured with priority	PASS

Ready for approval - proceed with Sprint 1.
